

# Automated Clinical Trial Monitoring

## Challenge: Burdensome Manual

In 2019, Enterin's clinical monitoring team manually created reports, spreadsheets, and letters for site visits. This process was time-consuming and error-prone, leading to delays in reporting and increased costs. The team spent significant time manually tracking site visits on a spreadsheet.

This manual process was a significant challenge for senior leadership and site managers, as it required a lot of time and resources to maintain accurate records and generate reports. The team needed a more efficient and automated solution to streamline their workflow and reduce the burden of manual data entry and report generation.

## Value

By automating manual work and bringing all of our data together, Rave CTMS has streamlined our entire clinical trial management lifecycle. This automation has significantly reduced the time and effort required to generate reports and track site visits, allowing the team to focus on more strategic tasks and improve the overall efficiency of their clinical trial management process.

The implementation of Rave CTMS has provided the team with a centralized platform for managing all clinical trial data, from patient recruitment to data collection and analysis. This integration has improved data accuracy and consistency, while also providing real-time insights into trial performance and patient safety. The team is now able to generate reports and track site visits more quickly and accurately, leading to faster decision-making and improved patient care.

### VALUE

Time savings from automated report and letter generation

Support for remote source data and site history

Support for remote source data and site history

**“By automating manual work and bringing all of our data together, Rave CTMS has streamlined our entire clinical trial management lifecycle.”**

Lisa Lutz  
Senior Manager for Clinical Monitoring, Enterin
